MSNE 407-408 2016-2017 Syllabus rev. 17Aug2016 P.Loos

CAPSTONE DESIGN PROJECT - An interdisciplinary capstone design experience. This course gives students an opportunity to use their knowledge and skills to solve a materials engineering problem. Each team of students will work together to design and produce an engineered material, process, or device to meet a prescribed set of requirements and subject to various constraints. Students must complete MSNE 407 to receive credit for MSNE 408, and both must be taken the same academic year. Required for the BS degree in MSNE. Instructor's permission required.

Instructor: Peter Loos ploos@rice.edu **Office:** MEB 215 **Office hours:** after class or by appointment.
Meets: 9:00-9:50 am MWF in DCH 1042 **Credits:** 4 in MSNE 407 (fall), 3 in MSNE 408 (spring)

In this class there are no tests, no quizzes, no final exam, and no textbook; however, there will be several homework assignments. Many topics, tools, and ideas will be presented. Students must combine those with their knowledge of materials and engineering to design and produce a useful material, process, or device. To succeed in this class, students need to act at their own initiative, work hard, overcome obstacles, find their own resources, engage in effective teamwork, and be creative, objective, and analytical.

One or more projects will be scheduled for the duration of both semesters. These projects, which are the primary focus of the course, will be described in detail at the beginning of the fall semester. Students will be divided into teams of about three to five, and among the projects as much as possible according to their preferences.

A second focus of the course are ABET requirements per www.abet.org/accreditation/accreditation-criteria/criteria-for-accrediting-engineering-programs-2015-2016/ .

Consequently, a student's responsibilities in this course are divided into two areas:

1) **Classwork and homework on important topics in design, analysis, safety, and ethics:** instrument calibration, repeatability, reproducibility, rounding of measurement data, design of experiments, full and fractional factorial designs, linear models, interactions, refining the model, significance, testing the null hypothesis, function LINEST, reliability testing, censored data, function NORMSINV, ethics, conflict of interest, avoiding the appearance of impropriety, failing to warn the public, making fraudulent claims, materials safety, Safety Data Sheets, failure modes and effects analysis (FMEA), teamwork, Pugh decision matrix, etc. Classwork will occupy two to three hours a week in the fall semester, but only one or two in the spring.
2) **The project work: team meetings, design, experimentation, analysis, and reporting** both verbally and in writing. Early in the year each student should be devoting an average of about 3 hours per week to the project, but toward the end of the year about nine hours/week.

Requirements and deliverables related to the project are summarized as follows:

- Weekly meetings of the project team with its advisor
- Individual student's project log books with bound and numbered pages.
- Team project binders containing all documentation (reports, presentations, disk files, and supporting materials)
- End-of-semester team oral presentations and written reports about the project
- A functioning prototype that has been tested against design criteria

Grading Policies: Semester grades are 60% individual effort and 40% team performance, as follows:

Team effort on the project	**Individual effort**
5% Project binder (including all documentation)	10% Project logbook = lab notebook (increases to 15% in Spring)
10% End of semester oral presentation	20% Attendance & participation at lecture & team activities
5% Weekly progress reports	20% Contribution to team's design and achievement of goals
20% End of semester written report & design execution	10% Homework assignments (reduced to 5% in Spring)

The Instructor, each team's advisor, and the TAs will jointly determine grades. Any disputes over grading should be brought to Instructor and/or advisor in a timely manner. The following four grading rubrics will be provided to the students and used in grading of particular assignments: **Design Review, Lab Notebook Grading Rubric, End-of-Semester Reports,** and **Rubric for Final Oral Presentation.**

Homework: There will be about six homework assignments in the fall and about three in the spring.

Absence Policy: Attendance in class is required and will be factored into the course grade. Attendance at team meetings is equally important and also required. If absence is unavoidable, then students must notify other participants (Instructor, advisor, and/or team members) as soon as absence becomes likely.

Honor Code Policy: **For "pledged" assignments** students must do all the writing, calculating, and analyzing themselves, must **not** examine or copy from any work done by any other student (past or present), and must include and sign the Rice Honor Pledge on work turned in. **For all assignments** students are encouraged to talk to each other, the Instructor, project advisor, or anyone else with knowledge of the subject. Plagiarism and other academic fraud will be addressed per the Honor System Handbook.

References: When quoting or giving data from a source other than class lecture slides or one's own original work, a proper reference must be given. Use ACS format per pubs.acs.org/doi/pdf/10.1021/bk-2006-STYG.ch014 or in simpler form at: http://library.williams.edu/citing/styles/acs.php

Intellectual Property: Projects sponsored by organizations outside of Rice may be subject to a sponsored research agreement, in which case students and faculty participating in the projects must sign a sponsored project participation agreement covering – among other things - confidentiality of the sponsor's proprietary information, publication or public presentation of the team's results, patent application & ownership, and copyright registration.

Software: Students will use spreadsheets such as MS Excel or OpenOffice Calc, particularly their LINEST function, for some of the homework and project data analysis, as well as word processors such as MS Word or OpenOffice Writer for reports, and MS PowerPoint or OpenOffice Impress for presentations. For compatibility, all files should be saved in either XLS, DOC, PPT, or PDF format.

Goals for this course:

To address ABET Student Outcomes and Program Criteria, students will have

(b) an ability to design and conduct experiments, as well as to analyze and interpret data
(c) an ability to design a system, component, or process to meet desired needs within realistic constraints...
(d) an ability to function on multidisciplinary teams
(e) an ability to identify, formulate, and solve engineering problems
(f) an understanding of professional and ethical responsibility
(g) an ability to communicate effectively
(k) an ability to use the techniques, skills, and modern engineering tools necessary for engineering practice

and the course will help prepare graduates

- to apply advanced science ... , computational techniques and engineering principles to materials systems ...
- to integrate the understanding of the scientific and engineering principles underlying the four major elements of the field: structure, properties, processing, and performance ...
- to apply and integrate knowledge from each of the above four elements of the field using experimental, computational, and statistical methods to solve materials problems including selection and design …
